

OEM AND PRIVATE LABEL

Products for your equipment and your brand

Bring a product to market, complete an equipment bundle or configure a component for an installation. ComponexX combines product sourcing with practical engineering support across fiber, RF, power and outside plant.

Fiber enclosures

Adapter interfaces, cable entries and grounding options.

Cable assemblies

Connector combinations, cable construction and lengths.

Access terminals

Port layout, splitter options and mounting.

Power distribution

Outlet layout, cord format and brand presentation.

RF passives

Attenuation, interfaces and product identification.

UPS & Power Backup

AC UPS and DC backup: load, runtime and connections.

A broader offering to start from

Our wider range includes optical passives, transceivers and outside-plant hardware. Share the requirement, even if the project is still taking shape.

Configure the product and the program

Bring your application to one point of contact for product selection, technical coordination and repeat supply. We work with our manufacturing partners to turn the agreed requirements into a defined configuration.

Choose your starting point

Established products. Select a defined configuration for resale, equipment integration or customer installations.

Private label. Build your offering around a selected product with your branding, labels, instructions and packaging.

Custom configurations. Review changes to connections, cable lengths, enclosure features or power arrangements for your application.

Configuration options in practice

A fiber connection point

Keep termination and stored fiber together in an enclosure configured for the installation. Select adapter interfaces, port count, cable-entry and grounding options.

A branded power accessory

Work with us to refine the product, develop your branded boxes and prepare launch materials. See the white-label power accessory use case.

An access distribution terminal

Bring the required connections into one terminal. Match the port arrangement, splitter configuration, lead lengths and mounting to the distribution plan.

A UPS or power-backup solution

Match AC or DC input and output, connected load, runtime and installation needs. Coordinate the required connections and mounting with the selected equipment.

From specification to repeat supply

We help define the configuration for quotation, coordinate samples and supporting documentation, and agree the product identification and packing. Approved specifications and artwork provide the reference for repeat orders.

We review the required ratings and documentation for your product and destination market.

Tell us what you want to offer

Send a reference product, photo, drawing or brief description, with your expected quantities and target market. We will help define the product options and the next step.

Discuss your product requirements
